

Requirements and Use Case Diagrams

- The requirements are written with the **User Story format** ("As a [role], I want [goal], so that [benefit]").
- From each user story, we can identify **candidate** actors and use cases — the diagram doesn't replace the full requirement, it complements it.

- **Role** → a candidate **actor** in the diagram (stick figure): someone or something outside the system that interacts with it.
- **Goal** → a candidate **use case** (oval/ellipse): what the actor wants to achieve.
- **Association**: a solid line showing which actor participates in which use case.
- **System boundary**: a box marking the scope of the system we're building.
- Detailed fields (e.g., first name, salary) and acceptance criteria are **not** shown in the

Epic requirement:

As an "employer,"

I want to "generate reports,"

so that "I can manage my employees."

Sub-requirement 1:

As an "account manager,"

I want to "have an Accounting report including first name, last name, and salary,"

so that "I can track monthly salary payments."

Sub-requirement 2:

As a "staff manager,"

I want to "have a Staffing report including first name, last name, and job title,"

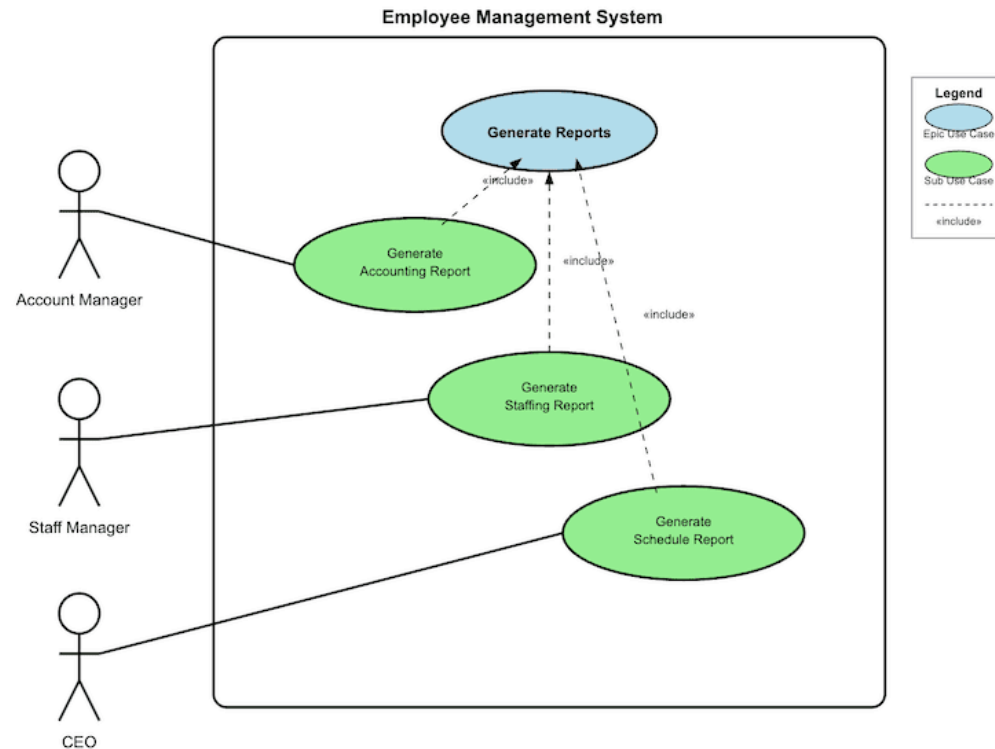

so that "I can track my staff."

Sub-requirement 3:

As a "CEO,"

I want to "have a Schedule report including start time and end time,"

so that "I can track my staff shifts."

- **Note:** the colors here (Epic vs. Sub Use Case) are instructional annotations for this course, not standard UML notation.

- Using use case diagrams, we can
 - Communicate better with stakeholders.
 - Help identify missing actors or user goals.
 - Define boundaries of the project.
 - Provide input for deriving user scenarios and acceptance tests.
